

Wuhu Electric Implements Intelligent Warehousing Information Management System

Recently, the Intelligent Warehousing Information Management System has been officially put into operation at Wuhu Electric. The system is divided into two platforms, namely a desktop client and a mobile client. It can directly carry out inventory business processing work such as a receipt, inspection, warehouse entry, material requisition, and inventory inquiry. At present, inventory processing business such as material purchase acceptance and material requisition has been undergoing a normal operation on the new system, and the overall operation of the system is stable.

The company is one of the second organisations that implement the China Power Intelligent Warehousing Information Management System. In mid-April, the company completed basic data collection, static data import, dynamic data import, and system switching according to work arrangements. Meanwhile, it also organised more than 40 relevant personnel of the company to complete system training by video.
